

1. Let Q, Q' be problems with $Q \leq Q'$ and $Q' \leq Q$. We say that Q and Q' are polynomial-time equivalent. Prove/Disprove: Any two NP-Complete problems are polynomial-time equivalent.

2. DOUBLE-SAT: Decide whether a Boolean formula has at least two satisfying assignments. Prove that DOUBLE-SAT is NP-Complete.

3. A CNF formula is called not-all-equal satisfiable if for some truth assignment of the variables, each clause has at least one true literal and at least one false literal.

NAESAT: Decide whether a Boolean formula in CNF is not-all-equal satisfiable.

Prove that NAESAT is NP-Complete.

4. Let $\Phi(x_1, x_2, \dots, x_n)$ be a Boolean formula in the conjunctive normal form (CNF). We say that Φ is all-but-one satisfiable if there is a truth assignment of the variables for which all except exactly one of the clauses of Φ evaluate to true. By AB1SAT, we denote the problem of deciding whether the given CNF formula Φ is all-but-one satisfiable.

5. Prove that if $P = NP$, then every non-trivial problem in this class is NP-complete.

6. **[Subgraph isomorphism problem]** Given two graphs G and H , decide whether there exists an injective function $f: V(H) \rightarrow V(G)$ such that

$$(u,v) \in E(H) \text{ if and only if } (f(u), f(v)) \in E(G).$$

Prove that SUBGRAPH-ISOMORPHISM is NP-complete.

7. Let P and Q be two problems in NP such that the same polynomial-time reduction f can be used for proving both $P \leq Q$ and $Q \leq P$. Prove/Disprove: f must be a bijection.

8. Every instance of a problem in NP can be encoded in binary. Without loss of generality, we can therefore assume that the space of input instances of all problems in NP is $\{0,1\}^*$. Invalid encodings can be assumed to belong to the REJECT set.

The intersection $P \wedge Q$ of two problems P and Q in NP is the problem having

$$\text{Accept}(P \wedge Q) = \text{Accept}(P) \cap \text{Accept}(Q).$$

- (a) Prove that the class NP is closed under intersection.
- (b) Prove that the class of NP-complete problems is not closed under intersection.

9. Suppose that we want to factor a positive integer n (may be assumed to be composite). This is not a decision problem. Formulate a decision problem that can be solved in polynomial time if and only if the non-decision problem can be solved in polynomial time.
